

Request Mapping

Spring MVC View Resolver:

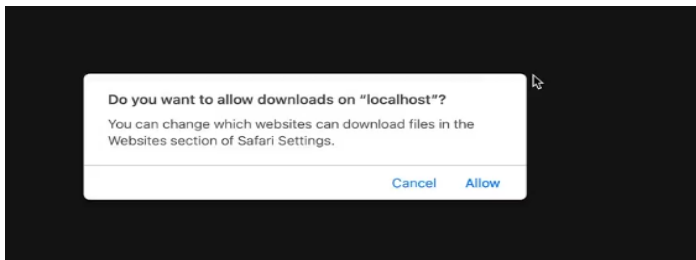

- Configures paths to locate JSP files using `spring.mvc.view.prefix` and `spring.mvc.view.suffix` in `application.properties`.

Tomcat Jasper Dependency: Enables JSP support in Spring Boot.

1. If you want to map (use annotation called `@RequestMapping("/")`)

```
@Controller
public class HomeController{
    @RequestMapping("/")
    public String home(){
        return "index.jsp";
    }
}
```

2. Run

⇒ You get something to download.

3. Why isn't it working?

⇒ By default, Spring Boot does not support JSP.

⇒ Need dependency [MVN Repository](#)

As per the Tomcat version, use the Tomcat Jasper version.

4. Run again.
